

Ideation Phase

Restrict Record Access
Based on Field Value

Date	29 September 2026	Team ID	SWTID-2026-6990
Project Name	Script-Controlled ACL	Maximum Marks	4 Marks

Project Focus

The project focuses on implementing a Script-Controlled Access Control List (ACL) that restricts access to records according to a specific field value. The solution uses Users, Groups/Roles and ACL logic so that only authorized users can view or access records that meet the defined condition.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement

In a ServiceNow environment, giving users access only through basic roles may not be sufficient when record access depends on the value stored in a particular field. Without field-based control, users may be able to view records that they are not authorized to access. A controlled mechanism is therefore required to check the field value and allow or deny access dynamically.

Requirement Identified

- Create the required Users and Roles/Groups according to the access requirement.
- Define which users are allowed to access specific records.
- Create a Script-Controlled ACL for the required table and operation.
- Check the selected field value through the ACL script before granting access.
- Allow authorized users to access matching records and restrict unauthorized users.
- Test the ACL using different users, roles and field values.

Step-2: Brainstorm, Idea Listing and Grouping

Category	Brainstormed Idea
User Setup	Create test users representing different access levels.
Role Setup	Create/assign the required roles or groups based on the requirement.
ACL Design	Create a record-level ACL for the required table and operation.
Script Logic	Use a script condition to compare the record's field value with the user's authorization.
Access Testing	Test permitted and denied access with multiple users.
Validation	Verify that changing the field value changes access as expected.

Grouping of Ideas

Access Setup: Users + Roles/Groups **Security:** ACL + Script Condition **Verification:** Positive/Negative Access Tests

Step-3: Idea Prioritization

The ideas are prioritized according to their importance for completing the Script-Controlled ACL milestone.

Priority	Activity	Reason
1	Create Users and Roles/Groups	Required to establish the access levels used by the ACL.
2	Create the ACL	Provides the main security control for the selected table/operation.
3	Add Script-Based Field Check	Ensures access depends on the required field value.
4	Test with Authorized User	Confirms that valid users can access permitted records.
5	Test with Unauthorized User	Confirms that restricted users are denied access.
6	Document the Configuration	Records the users, roles, field condition and expected results.

Expected Outcome

- Authorized users can access records when the required field condition is satisfied.
- Unauthorized users cannot access records that do not meet their permission condition.
- The project demonstrates dynamic, script-controlled record-level security.
- The Users, Roles/Groups and ACL configuration can be tested and demonstrated clearly.

Final Selected Idea

Script-Controlled ACL – Restrict Record Access Based on Field Value

Implement a field-based ACL using script logic, supported by specifically created Users and Roles/Groups, to dynamically control record access.
