Restrict Record Access Based on Field Value						Project : Script-Controlled ACL
	Entice	Enter	Engage	Exit	Extend	
	How does someone become aware of the need for secure field-based access?	What do people experience as access configuration begins?	In the core security moments, what happens?	What happens when the access rule is completed?	What happens after the ACL is deployed and maintained?	
Steps	Learn that record access must be restricted according to a field value.	Review the business/security requirement and identify the sensitive field.	Understand the need for a Script-Controlled ACL rather than broad role access.	Confirm the table and access operation to be controlled.	Decide which users should be allowed or denied based on the field value.	
Interactions	Open ServiceNow and locate the target table.	Create or identify test users and assign required roles/groups.	Identify the field whose value controls access.	Create the ACL and open the script condition.	Enter and review the field-based access logic.	
Goals & motivations	Help me understand the exact access rule.	Help me configure users and roles correctly.	Help me test both allowed and denied access.	Help me confirm the ACL is enforcing the field condition.	Help me avoid giving users unnecessary record access.	
Positive moments	Clear definition of the field and access rule.	Users and roles are configured without confusion.	Authorized user can open the correct record.	Unauthorized user is blocked as expected.	The final rule is documented and easy to explain.	
Negative moments	Unclear requirements about which records need protection.	Incorrect roles or groups may affect testing.	Script syntax or field names may cause unexpected results.	Access may be allowed or denied incorrectly.	Repeated testing and troubleshooting can take time.	
Areas of opportunity	Create a simple field-based access matrix.	Use dedicated test users for each access level.	Add clear comments and validation to the ACL script.	Test multiple field values and user roles before deployment.	Maintain documentation and review the ACL when requirements change.
