

Project Design Phase

Problem - Solution Fit

Date	29 September 2026
Team ID	SWTID-2026-6990
Project Name	Script-Controlled ACL - Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Problem - Solution Fit: The project identifies a record-access problem in ServiceNow and proposes a script-controlled ACL that checks a field value together with the user's role/authorization before allowing access.

1. CUSTOMER SEGMENT(S) ServiceNow administrators, developers and security teams who manage access to business records and need field-level conditions.	6. CUSTOMER CONSTRAINTS Complex ACL rules can be difficult to configure and test. Multiple roles/groups and incorrect field conditions can cause unwanted access or denial.	5. AVAILABLE SOLUTIONS Basic role-based ACLs, user/group permissions and manual record restrictions are available, but they may not cover dynamic field-value conditions.
2. JOBS-TO-BE-DONE / PROBLEMS Restrict records based on a field value; manage users and roles; prevent unauthorized users from viewing records; reduce manual access handling.	9. PROBLEM ROOT CAUSE Access is often controlled at a broad role level, while the real requirement depends on data stored in a record field. A field-aware decision is needed.	7. BEHAVIOUR Admins define users and roles, configure ACLs, add script conditions, test with different users and field values, and troubleshoot access results.
3. TRIGGERS A requirement to hide records for certain users, a security review, a new business rule, or a need to restrict records according to a field value. 4. EMOTIONS: BEFORE / AFTER Before: concern about over-permission and configuration errors. After: greater confidence that authorized users can access only the required records.	10. YOUR SOLUTION Create a Script-Controlled ACL that evaluates the target field value and the current user's authorization. Create required users and roles/groups, then allow or deny access dynamically.	8. CHANNELS & BEHAVIOUR ServiceNow admin console, ACL configuration, user/group records, role management, test accounts, system logs and access-control testing.

Problem-Solution Fit Summary: The key fit is between the need for record access that changes with the value of a field and a script-controlled ACL that evaluates that condition for each user.
